

Considering the use of HF for UFO empowerment, I began to wonder if I could possibly understand it at all?

But then I realized, with only a little thinking, that I “get it”, perfectly. Ergo, HF is not the same as LF in as much as resonance nodes can change everything so much so as to flip polarity of the behavior of a circuit first one way – and then into its opposite behavior – by causatively altering either the frequency or the self-induction of a simple step-up transformer or both.

Eric Dollard claims that a lightning bolt forms laterally to aggregate energy into its central column, not due to electricity moving upwards or downwards, but horizontally from a radius surrounding it. The area of the central column – where the lightning is undergoing formation – is the dielectric arena which is gravitating a charge by way of attractive forces generated by electrostatics building up.

But this is not consistent with the evidence for how UFO's stay afloat if it were not for HF's and their resonance nodes affecting the outcome.

The story, which comes to mind, is that of Wilhelm Reich shortly before he was arrested. He was witnessing a cloud, which he was endeavoring to dissipate, when – to his surprise – the cloud was surrounding a UFO! When the cloud dissolved (due to the action at a distance of his cloud busting technology directed at this cloud), the UFO immediately fell to the ground. He rushed to the scene expecting to find alien survivors, if he was lucky, to lend them a hand and offer an apology for ruining their trip to Earth. To his shock, the army showed up and arrested him for it was one of “their own”.

If it is true that these clouds, formed by UFOs, generate a positive ionic area immediately surrounding them, and if this polarity of HV is required for their being aloft, then this runs against what Eric has described about the behavior of the dielectric of a capacitor unless I include HF resonance and then the picture changes in a dramatic way. Without this explanation, HV positive charges should attract objects towards the Earth's surface – not propel them, aloft – due to the Earth's charge being more negative and the sky being more positive. Instead, at LF's, they should attract one another. This simple-minded expectation also explains why the atmosphere “clings” to the Earth much like static cling attaches Saran Wrap to a smooth object – such as plastic surfaces.

But UFO's are not simple devices. They alter “natural inclinations” of dielectric lines of force by altering the natural occurrence of LF by imposing artificially induced HF.

For it is HF which will alter the behavior of charges accumulating around a dielectric by either attracting or dispelling them based on the additional factor of what frequency is occurring? These resonance nodes control the rise and fall of such craft – even so much as to make their deep sea diving possible sufficient to overcome their buoyancy under water.
