Captions	Edit
English	Current division via a shorted pair of transformers.

Summary [\[edit \]](#)

Description	English: This is what Pavel's discovery manages to accomplish: the higher-resistance, higher-impedance side of his transformer shunts its current over to the lower-resistance, lower-impedance side. That's why it has so much current. Yet, this more conductive side has so much current since the other side of the transformer won't accept very much current. So, most of it has to go to the side of lesser impedance and lesser resistance.
