

Is it possible to make a self-powered free energy generator?

One way to generate free energy is to recharge batteries in the same manner as they were manufactured. The energy required to recharge them will be less than the energy which they will discharge, and they will regenerate themselves (ie, heal themselves) rather than suffer from burnout (especially if they are NiMH which were invented to withstand the following technique and benefit from it) due to the following criteria ...

Discharge is performed in the normal manner. But, the cycle for ...

Recharge uses high voltage and barely enough current to sustain the production of high voltage.

According to the fellow who sells \$5 plans for this technique (see link, below), approximately 600V is applied to lead acid batteries to recharge and regenerate them (heal them) at a cost of wattage which is less than the wattage which they will discharge.

Swap the batteries around (those which are discharging themselves into feeding the other group of batteries which are undergoing recharge), and a gradual increase of energy will become noticed according to this plan.

BTW, whenever lead acid batteries are manufactured, they use high voltage with low current to force oxygen into the lead plates. This forms lead dioxide there. This is in contradistinction to how conventional charging works in which hydrogen gas forms inside of the electrolyte whenever conventional lead acid batteries are discharged, but without putting any extra oxygen into the plates upon their recharge cycle. This deficiency of oxygenation of the lead plates encourages the formation of excessive hydrogen gas within the electrolytic solution surrounding the plates upon their discharge which is a corrosive acid (when it is in solution) which eats up the plates depositing a pile of lead scum at the bottom of the battery case. This scum builds up and does not go back onto the plates eventually causing an electrical short across adjacent plates.

It just so happens that batteries are manufactured to self-short immediately prior to the expiration of their warranty! Talk about a conspiracy to sabotage free energy! Wow!!!
