

It has been a year or so in the meantime a few new items have come to pass  
The photo below is a prototype motor that performs an interesting Output

The output is 270 watts running at 611 rpms  
The interesting part is the input to make this happen is 90 watts

The more interesting part is there are 2 coils that make 270 watts if 20 coils are used the  
output would be 2,700 watts  
The interesting part is the input is still 90 watts to produce 2,700 watts output

In fact this technology can produce megawatts using no input power, whatever is produced is  
usable power and that small amount of power needed  
to make this system work is removed from the generated power output. And this all conforms  
to the laws of Physics. Totally missed by everyone.  
Simple, Easy, no brainer tech. Just missed by everyone in Science, Electrical Engineering,  
Physics. and so on.

The Big Question: Should anyone be told how easy this can be done? Or should the world be  
left in the dark. Still.

Thanks Tom, Merry Christmas
