

# The Accelerative Force in Nature, which we have come to know as Gravity, is no different (in some respects) than the Electrically Reactive Force

Is Acceleration due to Gravity? Or, is it due to Reactive Power!?

How can you prove me wrong? You can't! All you can do is say that popularity is against me.

The accelerative force of electrical reactance is not unlike the exponential rate of replication enjoyed by viral organisms invading the cells of our body and “joy riding” our cellular processes for their own amusement and gain. Meanwhile, our white blood cells are busy killing them off at a linear rate and can't keep up with the propulsive onslaught.

This linear rate of viral death at the hands of our white blood cells is just like energy *{you know...the stuff that adheres to the Conservation of Energy Law?}* which functions at a linear rate of increase and decrease adhering to the conservative laws of thermodynamics.

Yet...Reactive Power is *not* a linear force! Far from it!

It is an accelerative force subject, exclusively, to its own self-feeding process of its output feeding its own input in an endless looping of what engineers sometimes prefer to call “useless energy” instead of the more neutral term (which they sometimes resort to) calling it, “lossless energy” – since it is potential energy not kinetically utilized by any of our appliances except to serve as a backdrop to energize coils, etc., and then be returned back to whatever energy source supplied this reactive power in the first place.

If this “reactive source of power” just happens to be more reactive power (compounding its growth at an alarming rate), then all the better for the “free energy enthusiasts” who are trying their best to conserve our natural resources.

This self-feeding process of reactive power is predicated on the equivalency between capacitance and capacitive reactance and between inductance and inductive reactance as a cause-effect relationship spelled out in no uncertain terms by the impedance formulae of electrical reactance....

Inductive reactance  $X_L$

$$X_L = \omega L = 2\pi fL$$

Capacitive reactance  $X_C$

$$X_C = -\frac{1}{\omega C} = -\frac{1}{2\pi fC}$$

$$X = X_L + X_C = \omega L - \frac{1}{\omega C}$$

$X_L$  equals  $L$  and  $X_C$  equals  $C$  in as much as  $L$  and  $C$  cause  $X_L$  and  $X_C$  to come into existence forming a new round of  $L$  and  $C$  spawning new values for  $X_L$  and  $X_C$ . This means that objects undergoing free-fall do not interact with some mysterious force of nature exterior to themselves in the process of speeding up. Their acceleration is totally self-referencing!

And, thus, does the gravitational force arise from the same root cause as does the electromagnetic force imparted to iron. Likewise, does the levitational force arise from the paramagnetic force of aluminum since this latter force wants to throw itself off, or outwardly, from any gravitational force.
