Surge Arresters without Parity is a Society without its Aristocracy and without its Panhandlers

OCT 11, 2026

The only reason why surge arresters do not possess hydrogen gas greater than 20% of their volume is because anything greater than this limit — imposed by the industry — would violate one of the sacred tenets of our society. And that is: to never allow the instability of sovereignty to once again be held by the people. Either they don't deserve it or else they're not qualified — either way you look at it, the aristocracy doesn't want us to rule ourselves probably because it would prevent their efficient "grazing the cream off the top of society" for their own personal gain and appeasement.

Ever since the close of the American Civil War, we've reverted to corporate rulership. This is the very thing our American Forefathers fought the Revolutionary War against their British rulers was against the West Indies Corporation's heavy-handed control of the American colonies and their unfair selfishly benefiting from the handiworks of the colonial settlers. Meanwhile, later on, Gandhi peacefully fought against the East Indies Corporation's control of India for the same reasons.

Corporations don't care if their profits arise from other people's handiwork and whether or not the originators get paid a fair exchange for their labor.

Theft is the sleazy role which drives our so-called thriving economy along with a certain bitterness for how we have achieved this success.

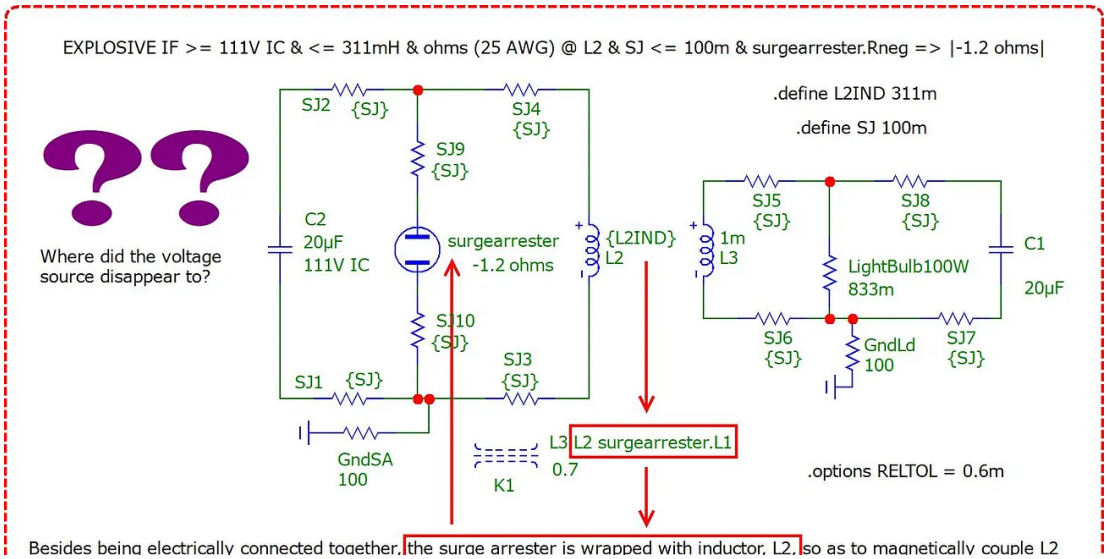

Well, if surge arresters were allowed to possess a hydrogen composition in excess of their standard of approximately 20% by volume, and less than 80% noble gases by volume, so as to induce an internalized, virtual negative resistance of -1.2 ohms or greater, then we'd have the makings of free energy for the masses.

Yet, the industry enforces a parity of negative one virtual-ohm serving as a limitation within the inherent design of all surge arresters disenfranchising free energy from public access.

It's that incredibly simple.
