The Potentials of Gravity versus the Energetic Release of these Potentials via Electrodynamics.

VINYASI
OCT 26, 2025

What I am initially formulating in my head from reading one of Tom Bearden's suggested ideas hyperlinked in the first of my two posts of his two lectures »

"AIDS, Biological Warfare" — a PDF scanned copy of this book hosted at RexResearch and cited by Tom in his first lecture »

» is that capacitance generates gravity and the magnetism of inductance is its release.

Published in *Applied Physics Letters* (vol. 40, pp. 450–452) in 1982 by J. O. White, M. Cronin-Golomb, B. Fischer, and A. Yariv, this paper documents the first experimental observation of coherent oscillation via self-induced photorefractive gratings in a barium titanate $BaTiO_3$ crystal. The research details a passive phase-conjugate ring resonator driven by four-wave mixing and beam coupling inside a single crystal of $BaTiO_3$ without requiring an external pumping beam. For further reference details, visit **Researching**.

At this point, I had to pause my rereading of Tom's book on AIDS, Biological Warfare at PDF page 144 having skipped ahead of the opening text all the way to PDF page 100. So, I have a lot of reading to do since I merely read 44 pages!

> As an aside, I don't believe that gravity exists due to this conventional concept conflicts with the fact that all celestial objects, such as: stars and planets, are hollow. Gravity has no place in explaining the dynamics of how a debris field is first attracted toward and then repelled from a hollow celestial object since gravity (as I understand it) is not capable of generating a repulsive force. The concept of buoyancy has no such shortcoming since it balances and incorporates both attraction with repulsion.
>
> Instead of gravity, I propose that all stars are planets whose oceanic atmospheres are a sea of ionized gases. And these planets are all

hollow to truly *conserve* (i.e., **minimize**) the required quantity of energy necessary to keep them in orbit around a larger celestial object or set of objects.

Inside these celestial objects are rotating metallic disks which generate an electrostatic force of attraction for steering cosmic debris into orbit around these central disks. This debris field constitutes what we see as being a spherical planet or star yet is hollow to help minimize the expenditure of energy necessary to keep it in orbit around something (else) much larger than itself.

A rotating metallic pair of counter-rotating disks generates an electrostatic gradient extending outward from its center of spin. The pairing of two counter-rotating metallic disks ensures their zero magnetic magnitude because of their cross-cancellation of their magnetism. Cosmic debris drawn into orbit around these disks will then find its comfortable position distant from the center of spin of these pairs of rotating disks settling into a favored orbital position and, thus, define this celestial object's non-observable inner and observable outer diameters.

This hypothesis requires that the dominant material of a celestial object's debris field will always be magnetizable, such as: iron. Hence, this is merely a hypothesis with insufficient data to substantiate. The predominance of the Sun's planetary surface composed of Calcium Ferrite is merely one good example.

This magnetizable debris field is mimicking the general nature of magnetic fields which close upon themselves in closed loop formation. This is in contrast to the dielectric lines of force which extend outward from a spinning metallic disk. This metallic disk is at one end of these dielectric lines of force. These lines of force attract magnetizable debris by connecting the other terminal endpoint of these lines of force with this cosmic debris to facilitate the movement of this debris towards the metallic disk.

The evidence for substantiating my understanding of Tom Bearden is from the short historical development of the EV Gray motor first by Marvin Cole who freaked out and left his models but took his documentation and list of associate helpers with him along with his girlfriend when they left Los Angeles due to his accidentally stumbling upon the levitation of his EV Gray motor experiments.

Yet, on the other hand, his successor: Richard Hackenberger, had a different problem in that he released the gravitational potentials of capacitive impedance which Marvin Cole had developed and focused upon and, thus, converted these potentials into EM waves which disturbed the neighborhood surrounding the EV Gray lab *(located in the heart of the city of Van Nuys, located in the geologic location of the San Fernando Valley, within Los Angeles county, California)* causing radio interference and a subsequent 1970s raid by the FCC.

So, each of these two researchers were substantiating what Thomas Bearden is saying — in each researcher's own way — exemplifying the two principles which Tom is sharing with us.

In my simulation work, I have witnessed simulations which lack a place wherein to bleed out of themselves the vast potentials which they develop creating a very static condition of impracticality. Not until I install a ground, or some or another similar device, will these potentials have a chance to develop any flow of current and give a more "balanced" state of evolutionary development to my simulated endeavors.

So, Bearden makes sense to me.
