steady-state ball of plasma at, or slightly below, atmospheric pressure in laboratory experiments but only with steady-state RF energy input. More recently, Ohtsuki and Ofuruton" have reported the generation of plasma fireballs formed by microwave interference in air. The frequency was 2.45 GHz, at power levels from 1 to 5 kW. These microwave-generated fireballs lasted several minutes and were reported to have lasted from 1 to 2 seconds after the microwave power was turned off. These microwave-generated atmospheric plasmas are hard to understand in terms of known dissociation processes in air, but the requirement for steady-state RF energy input makes the relevance

of these experiments to ball lightning unclear. The Vortex Plasmoid model, a model based on a self-contained magnetically confined plasma, the "vortex plasmoid," has been discussed by Singer³ and is illustrated in Fig. 5, taken from Ref. 3. This model sees ball lightning as a luminous, self-contained toroidal plasma configuration having a large toroidal current ring, the magnetic field of which interacts with the earth's magnetic field. One difficulty with this model is that the observed motion of ball lightning appears to be independent of the local direction of the earth's magnetic field at the point of observation. This

Ideal transformer construction update

VINYASI · JUN 22

[Listen now](#)

Aluminum clad, iron core, substrate wire wound around a dielectric canister of one or more noble gases all of which is underneath the primary and secondary insulated copper winding of an ideal transformer.
