JAN 22, 2026

The **Australia Antigen**, also known as HBsAg, is a surface antigen of the hepatitis B virus (HBV). Its presence in the blood indicates an existing hepatitis B infection. The term “Australia Antigen” originated from its discovery in an Australian aborigine, and it is now recognized as a key marker for diagnosing hepatitis B. This antigen plays a crucial role in screening blood donors to prevent hepatitis B transmission. Overall, the Australia Antigen is significant in understanding and managing hepatitis B infections. — [Australia antigen](#) (search)

The olive leaf has **antiviral properties**, giving it the ability to treat the common cold and dangerous viruses, including candida symptoms, meningitis, pneumonia, chronic fatigue syndrome, hepatitis B, malaria, gonorrhoea and tuberculosis; it also treats dental, ear and urinary tract ...

---

I once came down with hepatitis B from kissing someone who was infected. My blood, consequently, tested positive. It had tested negative immediately prior to kissing this stranger on the lips (tongue and all; yuck). I went to the herbal store, after a little research on the internet, and purchased plain olive leaf powder -- not the extract; don't bother with that.

I sprinkled it onto my twice a day meal plan for four days. I became so disgusted with the bitter taste, that I stopped consuming it.

One week after the positive blood test, I went back and had another blood test which came back negative for hepatitis B.

I highly recommend olive leaf. But avoid the extract. Only use the pure, simple powdered leaf of the olive tree.

Good luck.
