

Do Suppositories Bypass the Liver?

This was the question which I posed to AI.

VINYASI

APR 06, 2026

This is a trick question since AI won't give you an answer, or a straight answer, unless you're careful how you word this. AI may "beat around the bush" hemming and hawing like a cornered politician and refuse to give you any answer if you're not careful how you word it.

The answer is: Yes!

What does this mean?

It means that if any man butt-fucks any other mammal, then that mammal will experience alcoholism in the worst way since the absorption of alcohol will bypass the liver. This alcohol will be produced by the yeast in the rectum and the last few inches of the large intestine and will also bypass the liver for processing.

This lack of processing will ensure a slow but certain destruction of the entire physiology over time.

Worst of all, if a man should butt-fuck a pregnant lady, he is destroying the fetus as well but to much larger extent than what he is doing to the lady.

You can't say I haven't warned you.

So, to recap:

The entire gastro-intestinal tract routes all absorptions to the liver, first, before the rest of the body gets a hold of the absorption except for the last few inches of the large intestine plus the rectum. This latter portion of the GI tract routes all of its absorptions directly to the entire body, including the liver, but bypassing the liver as the sole initial point of passage.

For reasons I am ignorant of, AI does not want to enlighten, nor educate, us on this subject.

I wonder why?

Butt, there's a very good reason why Mother Nature engineered our butts this way.

If we didn't have this feature at the last few inches of our GI tract, then we'd never feel any urge to go to the bathroom to relieve our colon of the buildup of its feces. We might feel a fullness there; butt we'd never feel any excited urgency.

This feeling of urgency is vital, for without it, we'd be very inclined to make excuses and not bother to relieve ourselves.

This excitement comes about due to absorption of the toxins in this section of the colon's fermenting mass of "nightsoil". And this absorption MUST bypass the liver and go straight to the brain, etc. Go look it up on Wikipedia. It's called: "Excitotoxicity".

It is this excitotoxicity which stimulates the brain with extra oxygen consumption. And in this heightened state of anxiety, we are able to

recognize the urgency of relieving ourselves of these toxins.

Or at least some of them!
